Forewords.

This document describes the project of a decentralized DEEX cryptocurrency exchange. It's a trading platform of a new generation with the key idea of combining the best innovative solutions for modern cryptocurrency exchanges which will become the drivers for the whole cryptocurrency world in the near future. After the successful implementation DEEX has the potential to transform from a highly efficient crypto exchange to a global financial ecosystem that can effectively «live» in two worlds – the traditional and digital, gradually erasing the line between them.

DEEX functionality based on the most modern blockchain platform Bitshares 2.0 (Graphene). By the first time DEEX will use the ready-made engine of the Bitshares exchange. The second stage of the project development is connected with the creation of its own engine for DEEX on the Graphene platform with its own nodes and a global cryptocurrency (token) similar to BTS.

1. Introduction.

1.1. The cryptocurrency market today.

By our opinion the cryptocurrency market now is in the stage of "volatile growth", which began in late 2016 and most likely will continue in medium perspective. Sharp price fluctuations and correction are the natural state for this stage of development.

We believe that cryptocurrency market is not an accidental phenomenon and it is based on fundamental factors, which is confirmed by the eight-year history of development which began in 2009 when Bitcoin - the cryptocurrency which change the usual means of payment and digital transactions – has appeared.

Over the last 8 years Bitcoin and other cryptocurrencies only by the fact of their existence and growing distribution refuted many negative forecasts, opinions and assessments. They debunked some of the myths about their insolvency, the lack of prospects and the impossibility of changing global financial relations.

Over the mentioned period of time many alternative cryptocurrencies appeared. Many of them are embodying completely different ideas and fundamentally new concepts of economic ties. There is a gradual official legitimization of the legal status for cryptocurrencies and the integration of digital transaction elements into the traditional economic systems.

The number of people showing interest in cryptocurrencies is growing rapidly. This applies to professional traders and investors as well as ordinary users. Since the Bitcoin appearance the crypto community has grown from several thousand first enthusiasts to several million worldwide.

In 2017 the total capitalization of all cryptocurrencies (according to coinmarketcap.com) increased by more than 3400% from \$18 billion to \$613 billion. The daily trading volume for this period increased from \$130 million to \$27.2 billion (more than 200 times!).

Figure 1. Cryptocurrencies capitalization growth from 2013 till 2017.
(by <https://coinmarketcap.com>)

According to a study made by the British company Juniper Research in the end of 2017 the volume of transactions on the cryptocurrencies market could have surpassed the \$1 trillion and it is very possible that this mark will be reached in the coming days of 2018 (by January 7th, 2018 capitalization already reached \$832 billion).

The only aspect in which experts can't agree between themselves yet is the assessment of the scale and prospects of the new market. Some of them are pushing out bold and fast growth forecasts while the others are more conservative and insist on gradual integration into the world economy. But all experts have a common opinion in only one thing - this market is at the initial stage of realizing its potential and has a great prospect of further development, exceeding the current levels by dozens of points.

Based on these and many other factors and assessments, it is possible to come to a very concrete conclusion - staying away from this market means to standing still without seeing the prospect and to lose the profit which is now is on its maximum level by the point of view of the market in the initial stage of growth.

Cryptocurrency market is developing rapidly in many different directions, so it is very difficult to predict the profitability of a project in advance. However, we see the

most profitable strategy in organizing and creating our own crypto exchange platform, which will unite different cryptocurrency segments and will become a demanded trading mechanism for all participants - from traders to housewives. It is suitable for a variety of tasks and will be able to solve many tasks regardless of the specific user's activities and needs.

1.2. Cryptocurrency exchanges description.

At the present moment there are two types of exchange platforms – centralized and decentralized.

The main differences between them are the following:

- Centralized Exchange. All the main decisions are made by one governing body (center) and all participants depend on these decisions and almost never can affect them. Participants must keep their funds in the Exchange's wallets.
- Decentralized Exchange. It does not have a single decision-making center by all issues. It provides all participants with equal conditions and provide a platform where they can trade directly with each other.

Centralized Exchanges provide high margin and volatility of cryptocurrencies and tokens courses. They are easy to use, have easy access and provide advanced trading functions, such as margin trading, stop-loss, lending and others. As examples of centralized crypto exchanges we can name the well-known sites, such as Poloniex, Kraken, Bittrex, BitFinex, BitStamp, BTC-E.

Decentralized Exchanges is a fairly new phenomenon in the cryptocurrency world, most fully revealing the ideology of decentralized blockchain where all participants have an equal rights and opportunity to take part in the management of the Exchange's activities and to perform any operations of cryptocurrencies exchanging among themselves, holding money in a personal wallet but not in a third party's wallets (as it realized in centralized Exchanges). Their very important advantage is the highest degree of data confidentiality. Decentralized exchanges are BitShares, OpenLedger, RuDEX.

1.3. Decentralization is the modern trend.

Depending of many reasons centralized Exchanges are still very popular, because they offer customers a "ready" wide functionality, accumulated as a result of many years of practice.

The centralized Exchanges have only one serious drawback, which, to our great regret, based on its fundamental nature and plays an increasing role in the modern cryptocurrency world. This disadvantage is centralization, which is the main essence of these platforms.

The centralized system is exposed to risks by the following important indicators:

- **Security.**

There is a clear center where beat attackers. The total amount of funds abducted by hackers, starting with the history of MtGox, Bitfinex, etc., is estimated at hundreds of millions of dollars.

- **Unfair competition.**

Example with BTC-E and A. Vinnik, accused of fraud, theft and money laundering through BTC-E.

- **Danger of sanctions.**

Under the influence of US sanctions many customers from the countries in which these sanctions apply, can't withdraw their money from the Poloniex Exchange.

- **Political risks.**

The recent sharp change in China's policy towards ICO and cryptoexchanges in Beijing.

This list can be continued and continues with examples from the recent past but most of all it is alarming that this list will be updated in the future.

Proceeding from the foregoing it is necessary to ask an important question that sooner or later arises before each participant of the cryptocurrency market. How to protect yourself and minimize the risks of losing invested money? Is it worth the "old habit" of centralized exchange of probability to lose all at once?

By our opinion the answer to this question is quite obvious - the transition to a decentralized trading platform without all the risks described above and without a long list of challenges inherent in centralized exchanges.

We suggest that one of the most advanced platforms for creating a decentralized exchange is the BitShares 2.0 platform (Graphene), that's where we create the multipurpose decentralized Exchange - DEEX.

At the first stage it is planned to build the system on the existing BitShares Exchange engine. Next we will develop its own engine on BitShares 2.0 (Graphene) for DEEX with its own nodes and a global coin (token) similar to BitShares (BTS).

2. BitShares 2.0 - the basic functionality of DEEX.

BitShares 2.0 is a high-tech, decentralized, blockchain based platform which allows to create highly efficient financial "smart contracts" for all areas of economic activity that are used in global Internet space to provide services.

The BitShares 2.0 platform gives users a variety of undeniable advantages:

- Decentralization;
- High performance - up to 100,000 transactions per second;
- Cryptocurrencies trading with a stable price (BitAssets / SmartCoin);
- Dynamic Account Permissions (for corporate environment);
- Recurring & Scheduled Payments - periodic and planned payments;
- Referral rewards program;
- User-Issued Assets (UIA) – an assets created by the platform participants;
- Transferable Named Accounts – natural account names;
- Delegated Proof-of-Stake Consensus (DPOS) - Delegated Proof of Participation.

2.1. Decentralization.

Decentralization provides very high level of stability in case of accidental failures and deliberate attacks by intruders. In case the work of the centralized exchange is violated the consequences simultaneously affect all its participants. In a decentralized exchange, any cyber-attack or failure affects only one user or a small group of users but not all participants. According to the developers, to preserve the efficiency of the BitShares network it is enough to keep at least two computers functioning since each individual computer on the network contains a full copy of the of the entire network database.

2.2. High performance and low transaction cost.

The BitShares 2.0 platform allows data processing speeds of up to 100,000 transactions per second (at the level of centralized Exchanges) which makes it possible to perform instant operations in real time mode (maximum delay time is calculated in seconds, not hours like for other cryptocurrencies).

By the number of transactions Bitshares 2.0 is significantly ahead of Visa or MasterCard networks (their speed is about 20,000) and even the number of "transactions-reactions" (likes, posts, etc.) of Facebook users (about 52,000).

The maximum number of transactions per day (for 21-09-2017) in the BitShares network reached 920,000. This is more than Bitcoin and Ethereum networks ever show together. The largest number of transactions recorded in the Bitcoin network did not exceed 322,000.

Figure 2. BitShares blockchain daily transaction history.
(by <https://twitter.com/bitshares>)

The technical advantages of the BitShares 2.0 platform shown above are naturally reflected in significantly better economic indicators, and primarily in the cost of commission for the transaction, which is the minimum for today.

Figure 3. Bitshares 2.0 in comparison with its main competitors.
(by <https://bmchain.io>)

2.3. Stress-test.

The reliability of Bitshares 2.0 platform was specially tested by developers and a group of enthusiasts. This blockchain network proved its high performance and stability

during the peak periods of the load.¹

Figure 4. Average values of the number of transactions per block (the absence of discontinuities reflects the stability of the network).

2.4. Cryptocurrencies trading with a stable price (BitAssets/SmartCoin).

SmartCoin is a cryptocurrency which price level is supported by other assets, for example the US dollar (bitUSD) or gold (bitGOLD). SmartCoin is always provided with a reserve fund of 100% or more of the total value of circulating BitShares (BTS) on the Exchange. The reserves of the fund consist of the main currency of BitShares (BTS) system into which the SmartCoin coins can be converted at any time at a rate established on the market price basis. Like any other cryptocurrency SmartCoin coins are freely traded, are divisible and do not have any specific limitations.

2.5. Dynamic Account Permissions (for corporate environment).

Each account can be controlled by any valid combination of accounts (users) and private keys. This creates a hierarchical vertical structure model that reflects the methods of organizational control from real life and simplifies the management (control) of several users over the means of general regulation. Multiuser control is a significant contribution to overall security and with proper use it can almost eliminate the risk of money theft due to the hacking of a single account.

2.6. Recurring & Scheduled Payments (periodic and planned payments).

An example of a smart contract that performs permanent and subscriber payments. This feature allows users to provide third parties to withdraw funds from their accounts within certain limits and with a predetermined periodicity. This is a convenient way to pay by the "set and forget" basis for paying regular bills and subscriptions.

¹ Detailed information is provided by this link - https://docs.bitshares.org/_downloads/bitshares-stresstest.pdf

2.7. Referral rewards program.

Stimulates the involvement of new participants by existing participants paying them an appropriate remuneration. We plan to introduce a multi-level referral system on the DEEX Exchange.

2.8. User – Issued Assets (UIA).

Assets created by platform participants. This function helps participants to raise additional funds to finance profitable business projects by creating their own user token registered by the platform which can be stored and sold with certain restrictions. The creator of such an asset publicly names, describes, distributes and can indicate any individual restrictions such as a white list of accounts that can store tokens or carry out an associated trade and transfer fees.

2.9. Transferable Named Accounts.

Use of natural words to indicate the account's name instead of long and non-memorable characters as it done in the Bitcoin network. Each name is unique, and that excludes any risks of its substitution.

2.10. Delegated Proof-of-Stake Consensus (DPOS) – delegated evidence of participation.

Very stable and flexible protocol for confirming network blocks. DPOS is the fastest, most flexible and most efficient decentralized consensus model. DPOS uses the right to vote with the participation of stakeholders in resolving issues requiring common consent on a fair and democratic basis. All parameters of the blockchain from the payment schedules to the intervals and size of transactions can be coordinated through the delegates of the delegate community selected by all participants (they confirm the new network blocks). The deterministic choice of Delegates allows you to confirm transactions for a period from 1 to 3 seconds.

3. The DEEX main description and functional.

The BitShares 2.0 platform allows to implement the following main functional of the DEEX Exchange:

- Creation of a secure cryptowallet which allows to transfer funds with a minimum commission for all counterparties;
- Buy and sell cryptocurrencies and tokens;

- Create your own crypto assets and trade them;
- Make investments by buying tokens from prospective companies and participating in the distribution of expected profit;
- Create an ICO mechanism (primary coin/token placement);
- Ensure the highest security and reliability of all transactions in the blockchain network through the DPOS algorithm;
- Create accounts with escrow;
- Use special gateways (Gates) as mechanisms for transferring funds between different trading platforms and payment systems for fiat funds input/output.

4. DEEX advantages.

The first stage of business development will be connected with the creation of a reliable, convenient and multifunctional decentralized cryptocurrencies exchange based on the BitShares 2.0 platform with the integration of full functionality of the best DEX-exchanges. In the beginning of the ICO the DEEX' MVP is already being tested (the MVP presentation was in Skolkovo in December 2017) and small trades are being held already.

Our goal is to make the Exchange's functional comfortable for solving trader's current tasks at the first stage and at subsequent stages to implement the following functional:

- **A platform for safe ICO conduct** in conjunction with the decentralized escrow toolkit from descrow.org. DEEX will be used as a platform for prospective project's ICO, our specialists will carry out full project analysis, help them to receive funding from a permanent pool of private investors and further conduct pre-sale and large-scale ICO. DEEX tokens investors will receive a share of revenues from all ICOs;
- **A platform for creating a decentralized transparent blockchain system** for cryptofund managed by DEEX professional traders and issuing an appropriate stock token with automatic placement on both all DEX-Exchanges and leading centralized cryptocurrency Exchanges;
- **Cryptocurrency debit cards** linked to users' wallets on DEEX and integration into fiat gateways, allowing to convert cryptocurrency into fiat when paid by card in outlets;
- **API for the integration of third-party applications** and services with the DEEX platform;
- **Creation of the own agent network of crypto ATMs** for the purchase and sale of cryptocurrency for fiat money with the ability to work with bank cards.

The DEEX exchange will meet the increased demands of professional market players and be friendly to newbies. We want to make a competitive and profitable trading platform, a point for the development of crypto funds for trust assets management and an automated platform for ICO.

Existing decentralized crypto-exchange exchanges are a "toy for cryptogeeks", but not for non-professional traders or investors. Interfaces of such exchanges are inconvenient, unusual and unsuitable for traders who are used to trading on centralized exchanges. In addition, the DEX-exchanges have very low liquidity, which leads to slow execution of trade orders and as a result - to losses of traders.

Proceeding from the above, the key advantages of DEEX will be the following:

- convenient GUI, compatible with most modern browsers;
- desktop application for trading;
- mobile apps for Android and IOs;
- detailed and constantly updated documentation;
- 24-hour technical support;
- a large number of trading pairs;
- the ability to recover lost passwords;
- two-factor authentication;
- low commission fees;
- a high rate for the referral program;
- a wide range of trade indicators;
- trading robots;
- merchant;
- debit crypto cards;
- a network of crypto ATMs;
- high liquidity;
- own hardware crypto wallet for cold storage of cryptocurrencies and tokens.

In the future we are planing to introduce the following financial instruments:

- **DEEX.CORE** is a basic token which gives an opportunity to receive income from the exchange's participants activities through direct or indirect participation in the work of the exchange and projects implemented on it. Other words it is a mutually beneficial and low-risk investment in your own exchange.
- **DEEX.ICO** is an ICO token which allows to receive income from the ICO without having to examine the details of each individual innovation project. By purchasing this token, you can receive revenue from all conducted with DEEX ICOs; ICO is planned to be based on the solution of the decentralized escrow DESCROW.ORG

- **DEEX.FUND** is a cryptocurrency blockchain fund which allows to invest in different types of funds within the DEEX, depending on the level of the investor's attitude to risk. Managed by our fund traders with an extensive trading experience since 2004.

5. ICO release plan and monetization.

5.1. ICO release plan.

1. DEEX tokens presale which goal was to raise up to 3 000 000 dollars successfully completed. Total amount of investments is 3 410.44 ETH or \$2.5 million (the rate at the end of presale). Collected funds went to the target costs in accordance with the Roadmap.
2. The ICO will take place in several stages. At the first stage the key token of the DEEX.CORE ecosystem will be distributed. Distribution of digital tokens DEEX.CORE will be automated through Graphene / EOS blockchain technology without human intervention, which excludes financial manipulation, fraud, external interference, errors and possible mutual claims.
3. The base token value connected with US Dollar price and is set at \$ 0,10.
4. Funds will be collected through the ETH smart contract as well as through ETC, BitShares, Bitcoin, DASH coins.
5. All digital tokens will be placed on the Openledger.io and RuDEX decentralized Exchanges as well as on our partner's platforms in Southeast Asia.
6. Token will be issued on BitShares blockchain.

DEEX.CORE - is the main DEEX settlement unit, which will provide an opportunity to generate income from market fluctuations of other currencies thanks to the system of smart contracts which realized depending on rate's fluctuations of various cryptocurrencies. Our offer allows even ordinary users to receive an income depending of market's volatility without having to learn the nuances of market mechanisms.

DEEX.CORE will be used as an internal currency for payments and settlements in the DEEX Exchange cryptocurrency ecosystem. All counterparties working within the framework of the DEEX Exchange will be able to use our token in their internal calculations which will be the most profitable option for all business participants.

DEEX.CORE will be the most profitable tool for making payments on the exchange commission/fees or listing fees. Depending on the amount of tokens on the account, the amount of commission charged will be reduced. For the first year of operation of the DEEX Exchange the holders of the token can receive the following benefits, indicated in the table below (for subsequent years, this data can be changed to a smaller or larger side).

| | | | | |
|---|------|------|------|------|
| The amount of specific amounts will be determined after the ICO completion. | | | | |
| -50% | -40% | -30% | -20% | -10% |

The DEEX.CORE token will be an instrument for the development of the entire ecosystem. The owners of the token will have the right to vote for implemented projects implemented at the DEEX Exchange, which will increase its value and relevance and will also promote greater interest of all users in the participation of ecosystem development as a whole.

DEEX.CORE tokens will allow to receive reward for masternode's owners on their personal accounts. The more tokens on the account - the higher the amount of remuneration. In order to become a full masternode it is necessary to have a minimum balance in DEEX.CORE² on a personal account in the ecosystem (other tokens holders can transfer their tokens to the owners of masternodes on a rental basis and receive an appropriate fee). Owners of the masternodes will be able to receive revenues from charging commissions from transactions within the ecosystem and paying transaction commissions with tokens from other projects issued in the DEEX Exchange.

The profit in the DEEX ecosystem will be formed from all operations on DEEX Exchange (commissions for exchange transactions, for entering and withdrawing funds, etc.). The DEEX Exchange will distribute 30% of the quarterly profit among the holders of the DEEX.CORE token.

DEEX.CORE will be the "fuel" for the operation of the entire ecosystem. Every time a user makes a payment, a commission fee of 0.1% of the transaction amount in the DEEX Exchange is debited from his account and burned as a "fuel" for the transaction. Since all these operations will be displayed in the detachment, this mechanism can be called the most understandable and transparent without any hidden and incomprehensible commissions. The possession of DEEX.CORE tokens creates a reserve which can be used as a "fuel" for future payments/transactions.

² The minimum balance amount will be determined after the completion of the ICO.

The primary DEEX.CORE tokens share will be the following:

From October 26th 2017 till November 24th 2017 presale of DEEX.CORE tokens in the amount of 13 440 179 (for the amount of 3,410.44 ETH or \$ 2.5 million at the rate at the end of the presale), specially issued for early investors was held. In the future these tokens will be exchanged for tokens of the main ICO with a special premium.

From January 1st 2018 till the end of February 2018 the main ICO will be held in the amount of 100,000,000 tokens (minus the purchased on the presale tokens). The cost of the token is \$ 0.2 USD.

Additional DEEX.CORE issue and placement before the complete disposal of the issued tokens during the initial placement on ICO/ITO is not planned.

Tokens reserved for DEEX project Consultants (7% of tokens) will be frozen by the half-a-year period.

The minimum limits for tokens collecting will not be set.

5.2. Project's monetization.

The DEEX platform will be monetized by the following sources of profit generation:

- The platform will calculate and transfer 0.2% - 0.5% to the escrow account a floating commission for sales of cryptocurrencies, tokens and other digital instruments;
- The platform will provide an opportunity to buy cryptocurrencies, cryptocurrency pairs and tokens with a shoulder (margin lending);
- The platform will get profit by selling the technology of data exchange with other cryptocurrency Exchanges using the API technologies and developer services (SDK) for additional tools that expand the trading functionality;

- Integration of the possibility for carrying out transaction models and obtaining standard deductions from such transactions will also generate revenue for the platform that will be credited to the tokens for the holders (investors).

6. Marketing.

Taking in mind the specifics of the DEEX Exchange and its key feature - decentralization, the marketing strategy will be divided into two separate segments: for ordinary cryptocurrencies users and for the large players (investors and professional traders) who can not only trade, but also invest in the development of decentralized exchange technologies and also connect their currencies to the exchange. Their interest will be in the technology itself proposed by the decentralized platform.

The marketing strategy for ordinary users includes in it the permanent working with the most numerous cryptocurrency communities. The greatest interest as the most expeditious and accessible information solution for the marketing purposes are the various chats in popular instant messengers which consist of tens of hundreds of users who are the most active and most targeted audience. For them the main advantages of working with decentralized assets will be a branched referral system introduced.

For the second category of users (large players) it is necessary to build marketing activity from the position of universality and uniqueness of the DEEX technology. It is necessary to show that using the already implemented exchange solution it is possible to develop other projects that include the principle of decentralized work.

For both groups of users will formulate the main features of DEEX which will form the basis of the marketing strategy in short term (with further development as the technology develops): high transaction security and excellent protection against hacking and hacker attacks, low costs, the smallest commissions inside the blockchain, fast money withdrawal, reliability of assets storage.

The user engagement plan is based on a number of key strategies that will be used both in short and long term. The main accents are planned to make for advertising in social networks where the information is spreading much faster because of the significant influence of the word-of-mouth scheme. This is especially important at an early stage with a further prospect of increasing advertising costs for traditional advertising mechanisms and PR.

One of the key steps in creating a marketing strategy is to establish trust to the brand at an early stage. To capture the target audience and demonstrate all the advantages of the DEEX platform, a company to cooperate with the leaders of opinions in the field of cryptocurrency transactions will be held. Today social networks and

instant messengers have a large number of channels and blogs telling about the crypto currency in all its manifestations.

An additional source of promotion will be resources that are based on the Sluck messenger. Their use will make it possible to effectively communicate information about developments occurring around the DEEX project to a wide range of interested users. Along with this communities of crypto-professionals of the resource golos.io and popular Telegram channels and chats devoted to cryptocurrencies and trading on crypto exchange exchanges will be actively involved. Promoting through these channels we will regularly publish thematic materials from the DEEX team and commentaries will additionally attract recognized opinion leaders who have large weight in the crypto community.

In order to further increase the popularity of DEEX and create a positive image of the brand potential users will be provided with a referral system. It will allow them to earn and receive benefits from using the platform by involving new users. This is the most common system of marketing activity showing good results, especially at the initial stage of project functioning.

As part of the plan to promote DEEX it's expected to actively participate in core activities related to the functioning of cryptocurrency ecosystems. This is an important element of interaction with major market players and the possibility for attracting partners worldwide. The key factor for success in this area is the inclusion of specialists who develop the Exchange as speakers and consultants, as well as possible sponsorship.

7. Bounty campaign. Description and strategy.

7.1. Common information.

We believe in a decentralized economy and cryptocurrency community. That's why we are starting a bounty campaign at the pre-sale and ICO stages, so participants can help us to tell about DEEX Exchange platform to the community and get free coins as a bounty reward. In the DEEX ICO there will be 100 000 000 coins issued in total. As a bounty reward we will distribute 3% of total amount issued in ICO.

The distribution of tokens for performing campaign tasks will be made among registered users having an account in our system. Tokens receiving is made by login to the appropriate account. When registering an account, the user must specify the channels through which he plans to support the project in order to be able to track the publication of materials.

To receive a reward, the participant of the bounty program must create an account with a linked email. Tokens under will be credited directly to the linked account

and are available in the system wallet.

Figure 5. Tokens distribution in bounty campaign.

7.2. Description.

By completing bounty tasks user will receive bounty-tokens, which are divided in the following categories: twitter, facebook, bitcointalk and bitsharestalk signature campaign, writing blog posts and posting articles in popular media.

Facebook, VK, Twitter

Users need to follow our official Facebook, VK or Twitter page. Log in to the DEEX account. Connect Facebook, VK or Twitter and DEEX in the account page.

As users have connected their Facebook, Twitter and/or VK page, we count each repost automatically. They need just to repost our posts with the **#deex** hashtag. Shares to public pages and open groups are also accepted. All reposts must be public.

Repost news marked with **#deex** from our official account within 7 days (5 days for Twitter) after their publication and not later, and do not delete them for 20 days. Each repost will earn the following amount of tokens:

- 29 and less - 1 token;
- From 30 to 99 friends - 3 tokens;
- From 100 to 249 friends - 5 tokens;
- From 250 to 999 friends - 10 tokens;
- From 1000 to 9999 friends & followers - 20 tokens;
- 10000 friends & followers and more - 50 tokens.

The account must be at least 6 months old. The number of the followers is being fixed at the moment when user connect its account and doesn't change during the campaign.

NOTE: We count ONLY the posts that are marked with **#deex** by our official team. So, if you add our hashtag to any posts, it is not counted.

Bitcointalk & Bitsharestalk Signature Campaign.

We are glad to invite users to the DEEX Bitcointalk & Bitsharestalk signature campaign. They need just to upload the signature and avatar provided by us and write at least one constructive post within 3 days.

Each week completed will earn you the following amount of tokens:

- Legendary/Hero: 20 tokens;
- Sr./Full: 15 tokens;
- Member: 10 tokens;
- Jr. Member: 5 tokens;
- Avatar on: +5 tokens.

Conditions to earn reward in this category:

- Constructive posts in a 3 days minimum;
- At least 1 post a week must be constructive and in the DEEX thread;
- As you apply, we define your rank, and it will not be changed;
- To get signature rewards, you need at least 20 posts written;
- We will ban and will not send coins to spammers and multi accounts;
- We don't reward avatars, only as an addition to signatures;
- Users not posting posts per week will be removed;
- Receiving negative trust or ban during your participation in our campaign will result in you being disqualified from our campaign receiving nothing.

NOTE: If we feel there's a lot of spam posts you're making you will be removed from the campaign and receive no payment. Do not change signature during campaign.

Discussion Boards we do not count: Games and round, Micro earnings, Politics and Society, Off-topic, Archival, Auctions, Lending, Beginners and help, Press.

Write a post in blog/social media about DEEX.

Write a post about DEEX in any language, with at least 1000 characters and containing 3 links to deex.io. User can also make a video or movie about DEEX and post it via any popular video hosting.

Depending of the material quality we will class each article as following:

- standard (100 - 200 coins);
- nice (200 - 300 coins);
- great (300 - 500 coins).

It can be user's blog or social net personal page. The article should be available to the Internet. To class your article, we will check the popularity of your blog and the quality of the content.

NOTE: For professional journalist who can provide very popular resource for posting articles we are ready to discuss your reward personally.

To receive the reward, users need to send us the article with connected link and tell us about themselves and the article.

To summarize, the coins earned in each campaign will NOT be pooled together but rather the coins in each category will be divided in each category separately. The information about tokens already earned is displayed in the DEEX account. It is updated every 48 hours. Once all of the coins are counted, user will see the DEEX coins in its account. The coins will be distributed once the DEEX blockchain goes live.

DEEX Road Map.

- 26.10.2017 - launch of pre-sale;
- End of November 2017 - launching MVP and testing DEEX on the BitShares base engine;
- November 2017 - February 2018 - customization of the basic engine, improving the design and usability of the functionality for users, translating into additional languages, introducing the possibility of password recovery and two-factor authentication;
- January 2018 – February 2018 - registration of a legal entity for the exchange on Singapore;
- January 10th, 2018 - launch of the large ICO of the main ecosystem token DEEX.CORE;
- January 2018 – ICO for the first project in our ecosystem - a secure VIPPLE messenger;
- Early January 2018 - the launch of the DEEX.FUND crypto block system and the first tranche of the ICO fund;
- January 2018 - launch of the mobile exchange application;
- February 2018 - launch of branded ATMs based on the offices of our partners and investors in Spain, Turkey, Germany, Russia, Kazakhstan, Italy, Malta;
- March 2018 - December 2018 - transfer of the engine of the ecosystem into its own blockchain system based on the Graphene engine.

Glossary

| Term | Definition |
|---|---|
| Consensus Algorithm | Is the basis for the underlying protocol governing a blockchain's operation. |
| Coins/tokens/ SmartCoin | Cryptocurrency, which price level is supported by other assets. |
| Smart contract | A smart contract is a computer protocol intended to facilitate, verify, or enforce the negotiation or performance of a contract. |
| Fiat currency | Any traditional currency issuing by the Central Banks. |
| Hashtag | Is a type of metadata tag used on social network and microblogging services, allowing users to apply dynamic, user-generated tagging that makes it possible for others to easily find messages with a specific theme or content; it allows easy, informal markup of folk taxonomy without need of any formal taxonomy or markup language. |
| Escrow/escrow contract | A special account managed by proxies in order to increase investor confidence and safety. |
| API (application programming interface) | An application programming interface (API) is a set of subroutine definitions, protocols, and tools for building application software. In general terms, it is a set of clearly defined methods of communication between various software components. |
| BitShares | The largest public-based cryptocurrency system based on Graphene. The main token of the network is BTS, and the system itself provides the operation of many other tokens (ICOO, FUNC and many others). |
| BitShares 2.0 (Graphene) | Developed by Cryptonomex, an open source blockchain platform that uses DPOS as a consensus algorithm. |
| Blockchain | Is a continuously growing list of records, called blocks, which are linked and secured using cryptography. Each block typically contains a hash pointer as a link to a previous block, a timestamp and transaction data. |
| DEX | An abbreviation for any Decentralized Crypto Exchange. |
| DPOS | Delegated Proof of Stake (DPOS) is the fastest, most efficient, most decentralized, and most flexible consensus model available. DPOS leverages the power of stakeholder approval voting to resolve consensus issues in a fair and democratic way. |
| EOS | An operating system for blockchain applications. The project is based on asynchronous smart contracts that can run in parallel, which allows to achieve a performance of more than 100 thousand transactions per second. |
| ICO/ITO | Is an unregulated means of crowdfunding via use of cryptocurrency, which can be a source of capital for startup companies. |
| MVP | A Minimum Viable Product (MVP) is a product with just enough features to satisfy early customers and to provide feedback for future product development. |
| P2P | Peer-to-peer (P2P) computing or networking is a distributed application architecture that partitions tasks or workloads between peers. Peers are equally privileged, equipotent participants in the application. They are said to form a peer-to-peer network of nodes. |
| SDK | A software development kit (SDK or devkit) is typically a set of software development tools that allows the creation of applications for a certain software package, software framework, hardware platform, computer system, video game console, operating system, or similar development platform. |
